

Faster route modeling, faster bid wins

Eliminate static spreadsheets, accelerate proposal turnarounds and unlock real-time fleet analytics across your team.

Trimble Appian Analyst Sharing Portal bridges strategic route modeling and execution by transforming desktop files into interactive web links. By sharing dynamic PC*Miler maps, stop sequences, and KPI dashboards with internal teams and prospective shippers, fleets compress RFP turnaround times and align sales with operations.

- **One click publishing:** Publish complex scenarios directly from Appian desktop tools into secure, web-based cloud portals in seconds, eliminating static map exports, manual PDF building and confusing email spreadsheet attachments.
- **Interactive scenario viewer:** Give stakeholders dynamic PC*Miler maps, Gantt charts and sequence details to inspect stop constraints and compare baseline operations against proposed optimizations.
- **Collaborative bidding:** Streamline RFP responses and territory re-balancing by allowing sales leads, branch managers and prospective shippers to review route models and leave stop-level annotations in real-time.
- **Secure cloud control:** Maintain total governance over confidential fleet data by controlling viewer access with role-based permissions, custom metric visibility, domain restrictions and time-limited links on Trimble's secure cloud.

Eliminate the analyst bottleneck and start accelerating RFP wins with the Analyst Sharing Portal.
